

In general, defer to [Design.md](#) | [slideshow](#)

- **Main Menu Options (keep at 5):**
 - Home (explore page which plays the selected 15s of the songs with a video you like - video just for the 15s, not for the entire project)
 - Includes search
 - Rating
 - Profile (this is where you can see your friends)
 - communities
 - Projects - includes:
 - Create new project
 - Active projects - sounds you're working on
 - Sample library - sounds that you've created
 - Rarity system: will be based on voting
 - Voting - pop-up messages prompt users to vote
 - Messages also appear when users try to make stylistic changes and don't have enough tokens.
- **Creating an account** process (part of this will be music taste)
 - Based on music interests, communities appear that the user can choose between, like Real app
- **Home page**
 - **Search**
 - Search a specific album, genre, artist, or communities
 - See other popular projects
 - filter by communities or explore popular global
 - Audio button on each project that will play the best 15 seconds
 - **Viewing Another Project**
 - Hear unedited sound (full song or small piece)
- **Voting**
 - Voting page that compares two songs
 - Gain tokens
 - Tokens can earn stylistic details in the app - like background color, etc.
- **Personal profiles**
 - profile photo and background image
 - Stylistic edits can be made here, bought with tokens
 - music taste: 1-3 genres, top 2-5 artists
 - top three personal creations (song/albums)
 - See Friends
 - "ask to collaborate" button (when users are viewing someone else's profile)
 - **Collaborating** with friends/strangers through their profiles
- **Creating Projects**
 - Refer to the [slideshow](#) for settings
 - Choose a song, or an album
 - Automatically creates a group with a chat
 - Invite people to it

- The creator can assign sounds to people and can also designate co-leaders
- **Publishing Projects**
 - Choose between only friends/public for all
 - Choose communities to see it, or go global with a general community
 - Sampleable/not
 - Auto grading
 - Peer-reviews
 - Voting; if the user approves voting then they must select their favorite 15 seconds of the song to be displayed
- **User Workflow**
 - User logs into the app and modulates sounds; there is also a record button.
 - User reco
- **Production Process**
 - User presses create new project button
 - User is prompted to choose to make the project a full album remake or just one song
 - If the User chooses to make the project an album the user is prompted to choose songs from the album they want to include
 - User is asked to choose a song from the list of songs in the album they chose to start working on, this screen with the list of songs is effectively the project's first/main screen when the user clicks on the project from their projects tab
 - The song is broken up into different tracks/instruments, in rows, with midi rolls, this looks like any other producing software, except with much simpler UI
 - When the user clicks on a track, for example the piano, the screen switches to where the midi track is on the top of the screen, and the bottom has sliders and buttons to mess with the sample sound, somewhere big and obvious there is the record button where you record a sound within a length of .1 to 10 seconds
 - The sample is automatically pitched and stretched to each note's in the midi frequency and duration
 - There is a play button above the tracks where you can preview the song, using the sounds that have been recorded so far
 - There is a "Publish" button at the top – it will give a warning if not all tracks have been recorded. Then it will provide two options: publish publicly, or only visible to friends.
- **Editing Process**
 - For long instrument solos: record one standard note (middle C) at a standard length. The app changes pitch and length for all other notes in the sequence and strings them together. If the note lasts for too long (>1s), it will replay the note several times as stretching the clip would start to sound strange.
